

1. Normalisation is the process of organizing a relational database to reduce data redundancy and improve data integrity.
2. A table is in 1NF when:
  - All column values are atomic or every cell in the table holds only a single value.
  - Each column contains values of a single type
  - Each row contains or has a primary key
  - There are no repeating groups or arrays
3. A table is in 2NF when:
  - It is already in 1NF
  - Every non-key attribute is fully functional dependent on the entire primary key
4. A table is in 3NF when:
  - It is already in 2NF
  - There are no non-key attributes depending on another non-key attribute
